## Introduction and Study Purpose

The federal Every Student Succeeds Act (ESSA) requires states to identify schools for comprehensive support. In Washington, these schools are identified based on the Washington School Improvement Framework and include the lowest-performing five percent of all schools. The Washington State Office of the Superintendent of Public Instruction (OSPI) is considering new strategies and supports for these schools based on a broad variety of data and information. This includes an examination of hiring and workforce issues within these schools and districts. Given the composition of schools currently receiving comprehensive support, it is imperative to address inequities in student access to well-qualified educators that exist by region, district, and individual schools within the same district. In this study, we examine issues regarding the nature and challenges of staffing within Washington's comprehensive support schools.

Despite ongoing attention to the state's lowest performing schools, efforts to turn around schools with substantial challenges has not always resulted in sustained improvement (U.S. Department of Education). Studies examining the impact of school improvement initiatives present mixed evidence on the effectiveness of reforms, with some studies showing no measurable impact on school performance, and others that document substantial improvements (Bonilla \& Dee, 2017; Dee \& Dizon-Ross, 2017; Dickey-Griffith, 2013; Dragoset et al., 2017; Papay \& Kraft, 2015).

There is evidence that some of these studies did not adequately account for the fact that comprehensive school improvement requires time for positive changes to occur (Borman, Hewes, Overman, \& Brown; 2003; Sun, Penner, \& Loeb, 2017; Ginsburg \& Smith, 2018). Multiple factors contribute to the success of school improvement initiatives, including the quality and stability of teaching staff, the quality of leadership, organizational capacity, support for ongoing professional learning, and community engagement (Bryk, Allensworth, Luppescu \& Easton, 2010; Hitt, Woodruff, Meyers \& Zhu, 2018; Ishimaru, 2018; Leithwood, Harris \& Strauss, 2010; Loeb, Kalogrides \& Beteille, 2012; McAlister, 2010).

Among the strategies recommended for successful school turnarounds has been a focus on hiring and professional development to ensure the best possible teaching force and effective school leadership, and to build long-term capacity. This implies a shared authority and responsibility between districts and schools to recruit well-qualified applicants and retain them in the schools where they are most needed.

While in the past, hiring was often led and controlled by district office administrators, there has been a shift to increased involvement of schools in the hiring process, with school principals often serving in a lead role (Engel, Cannata \& Curren, 2018). This shift implies that a two-way, interdependent relationship between districts and schools is needed in order to maximize the capacity to recruit and retain a well-qualified workforce (Simon, Moore Johnson \& Reinhold, 2019). A Massachusetts study of teacher recruitment in six successful, high-poverty schools found that these schools cultivated relationships with the school district, universities, and
community organizations to develop networks that provided candidates who were committed to serving low-income students and students of color (Simon \& Moore Johnson, 2015).

Some research also suggests that effective teacher hiring depends on the use of multiple teacher recruitment strategies. An examination of teacher hiring practices in New York state found a relationship between the use of a wide variety of recruitment practices and the hiring of more qualified teachers compared to districts that relied on a limited number of strategies (Balter \& Duncombe, 2008).

Over the years, states and district have invested in a variety of financial incentives to attract and retain teachers, including raising beginning teacher pay, across-the-board salary raises, enhancements for attaining additional certifications, signing bonuses and tuition reimbursement. However, there is a lack of evidence about which types of incentives are most effective. Furthermore, these incentives are often treated in piecemeal fashion rather than thinking about "packages" of incentives that are tailored to specific types of recruitment needs (Kolbe \& Strunk, 2012).

Attracting and retaining high quality educators can present particular challenges for struggling schools. Educator labor markets are often regional, and different kinds of solutions may be needed. Additionally, there are substantial workforce concerns such as the lack of racial and ethnic diversity, areas of chronic, long-term shortage (e.g., math, science, English language and special education), and suggested declines in the number of individuals entering educator preparation programs. To date, the specific dynamics of the supply, demand and equitable distribution of teachers have not been analyzed in a comprehensive way. Consequently, current information about the state's educator workforce is insufficient to make well-informed policy decisions, particularly with regard to staffing in the state's lowest performing schools.

In order to understand school and district patterns of hiring, assignment and retention, this study examines multiple years of state administrative data as well as the collection of new data through survey methods.

## Research Questions and Study Methods

## Research Questions

OSPI identified 98 schools for comprehensive support by state and federal accountability processes for the 2018-19 school year. This study focuses specifically on the 98 schools and the districts in which they are located, as well as statewide and district comparative analyses. The overarching questions addressed in this study are:

1. How do the demographic characteristics, retention and mobility of teachers and principals in comprehensive support schools compare to the state and to demographically similar schools?
2. How do schools in comprehensive support and their districts address vacancies, areas of shortage, assignment, recruitment and retention?

These questions and other related issues will be examined using multiple sources of data. In the next section, we provide a brief description of the study methods.

## Study Methods

In order to examine hiring and workforce issues, two research methods were employed. One was the analysis of existing state administrative data. The second was the design and analysis of surveys administered to human resource directors and school principals in comprehensive support schools and their districts. We discuss each of these two methods below.

## Online Surveys

Two separate surveys were designed and administered for district human resource staff and school principals in the comprehensive support schools. The survey design included a "branching" of items such that different follow-up questions were asked based on participants' responses to earlier items. Survey items were developed by examining prior national surveys and revised based on feedback from state agencies and educator groups. Comments on the draft surveys were received from staff at OSPI, the Washington State Board of Education, the Association of Washington School Principals, the Washington Student Achievement Council, the Center for Strengthening the Teaching Profession, and the Washington State Education Association. Email addresses for potential school principal and district human resource participants were provided by OSPI.

The online surveys were administered through Qualtrics, an online survey provider for the University of Washington. Qualtrics allows participants to receive a unique link to the survey, thereby protecting both confidentiality and securing access to verified participants. The online instrument allows for individualized reminders and follow-up messages to be sent to those who had not yet completed the survey. The online surveys were deployed on April 3, 2019, and three reminder messages were sent to non-respondents to encourage participation over a five-week period. Two principals had administrative responsibilities for more than one school in comprehensive support and one also had responsibilities as a superintendent. Consequently, 95 principals and 57 staff with human resource responsibilities were invited to participate in the surveys.

A total of 36 of 95 principals responded to the survey for a response rate of $38 \%$, and 19 of 57 human resource staff participated in their survey ( $33 \%$ response rate). While we are accustomed to higher response rates to our surveys, these rates are better than most online surveys (typical response rates range from 15-34\%). To examine the representativeness of the participating principals, we compared the school characteristics for those participating in the survey to all schools in comprehensive support (see Table 1). As can be seen in Table 1, the
school characteristics of participating principals closely parallels those of all schools in comprehensive support in terms of school type, size, level, student poverty, proportion of students of color and region of the state. Most principal participants identified as experienced school administrators. Ninety-two percent reported they had four or more years of administrative experience in education. However, nearly half (47\%) indicated working in their current school fewer than four years, and one-quarter indicated it was their first year in the building.

| Schools in Comprehensive Support |  |  |  |  |  |

*Demographic data based on OSPI's School Report data for 2017-18.

We also compared the district characteristics of the human resource (HR) survey participants to all districts in which comprehensive schools are located (see Table 2). As can be seen in this table, a greater proportion of HR survey participants were located in smaller districts and those with fewer numbers of schools in comprehensive support. The fact that fewer participants from larger districts participated in the survey means that caution is warranted in interpreting some aspects of the survey data. Approximately $30 \%$ of staff participating in the HR survey indicated that they had worked in their district fewer than five years, and 63\% indicated they had responsibilities for more than just human resources.

| OSPI | 2 | 4\% | 0 | 0\% |

*Demographic data based on OSPI's School Report for 2017-18.

Survey data were systematically analyzed for similarities and differences by participant role (e.g., human resource director, principal) and other factors.

## Database Analyses

We use several data sources to conduct a statewide analysis of the retention and mobility patterns of teachers and principals. The primary data source was the personnel data from the state's S-275 dataset. This dataset contains demographic and assignment information about all educators in Washington state. We link the S-275 data to other state databases, including school and district demographic data to form a portrait of teacher and principal retention and mobility. We have access to multiple years of data, enabling us to conduct longitudinal analyses that are comparable over time. Using these state administrative datasets, we focused specifically on the last five years. For retention and mobility trends over time, we examined both five-year time periods, and year-by-year changes in demographic characteristics, retention and mobility. Both the five-year and year-by-year analyses are cohort-based. That is, we identify
teachers in a given year, and then examine their assignment in the workforce in the subsequent year.

We provide analyses of both five-year and year-by-year retention and mobility rates for all teachers statewide and comprehensive support schools and districts. For the purposes of this study, teacher retention and mobility includes both the extent to which teachers move to other schools and other districts, as well as leave the state education system. We describe the criteria for the teachers included in these analyses as follows:

- Teachers were defined as those public school teachers whose assignment is the instruction of pupils in a classroom situation and who have a designation as an elementary teacher, secondary teacher, other classroom teacher, or elementary specialist teacher (duty roots 31-34). Other teachers serving in specialist roles (e.g., reading resource specialist, library media specialist) were not included in the statewide analyses.
- Beginning teachers were defined as those public school teachers with less than 1 year of experience as reported in the S-275.

In order to examine retention and mobility patterns, teachers are placed in one of four categories:

- "Stayers" - teachers assigned to the same school(s) in the initial school year, and also in the subsequent year.
- "Movers in" - teachers who moved to other schools in the same district, or changed assignment (other than a classroom teacher) within the same district.
- "Movers out" - teachers who moved to other districts, either as a classroom teacher or in some other role.
- "Exiters" - teachers who exited the Washington education system, either temporarily or permanently.

For the principal retention and mobility analyses, we provide two five-year time periods. We define "principal" as an individual whose primary assignment is designated in the S-275 database as duty root 21 or 23 . Similarly, we define "assistant principal" as an individual whose primary assignment is designated as duty root 22 or 24 . We use the same four retention and mobility categories (Stayers, Movers in, Movers out and Exiters) for principals and assistant principals.

While this study provides an analysis of educator retention and mobility, including factors that may impact turnover rates, we do not examine other related issues. First, we do not address the reasons why individuals choose to move to other schools or districts, or why they decide to
leave the profession, either temporarily or permanently. Issues such as increased workload, quality of school and district leadership, support from parents and community, and personal and family factors are all known to influence educator's views of their careers. We also do not distinguish between individuals who choose to make a change in their assignment or location, and those who have been involuntarily transferred. Additionally, we make no claims about the quality of the performance of individuals who stay in their schools, move to another school or district, or leave the profession.

## Matched Schools

To strengthen the comparisons between schools in comprehensive support and other schools across the state, we identified a unique set of schools matched to each of the 63 traditional schools in comprehensive support ${ }^{1}$ with at least 10 or more teachers. We identified similar schools by type, level, student enrollment, and a proxy for school poverty (i.e., percent of students receiving free or reduced priced lunch). We included all schools that fit these criteria but excluded any comprehensive support schools. We then narrowed the list to the closest matching unique schools. Finally, we prioritized certain criteria to determine the final three matches for each school based on location, with priority given to schools within the same district, the same county, and then region of the state. The rationale for prioritizing by locale was that teacher labor markets are regional, and schools seeking to staff their schools within the same geographical area would potentially be a closer match than schools in another part of the state.

## Characteristics of Schools in Comprehensive Support

Washington's schools in comprehensive support represent a diverse group of educational learning contexts. Most of the 98 schools identified for comprehensive support (89\%) are traditional or alternative schools and are located in communities across the state. About a third (34\%) of these schools are located in Western Washington outside the Puget Sound region, $20 \%$ are located in the Puget Sound Region (ESD 121), and $43 \%$ are in Eastern Washington. The majority of comprehensive schools serve fewer than 400 students ( $58 \%$ ) and are primarily at the elementary level ( $53 \%$ ). Only two of the thirteen high schools in comprehensive support are considered traditional high schools. A small subset of comprehensive support schools (11 in total) are described as re-engagement or skills centers, facilities that offer children and youth specialized care, or juvenile justice institutions. Table 3 provides additional details. ${ }^{2}$

[^0]Table 3: Characteristics of the 98 Schools in Comprehensive Support in 2018-19

|  | Number | Percent |
| :--- | :---: | :---: |
| School Type |  |  |
| Traditional | 72 | $73 \%$ |

| Eastern WA | 3 | $3 \%$ |
| OSPI |  |  |

*Demographic data based on OSPI's School Report for 2017-18.

Schools in comprehensive support serve larger proportions of students in poverty and students of color compared to other schools in Washington state. Nearly $60 \%$ of comprehensive support schools serve students where $75 \%$ or more received free or reduced priced lunch. This compares to only $13 \%$ of schools statewide. More than half (55\%) of schools statewide have poverty rates that are less than $50 \%$, compared to only $6 \%$ of schools in comprehensive support (see Chart A). When examining the racial and ethnic makeup of students, $69 \%$ of schools in comprehensive support are schools where students of color are in the majority ( $50 \%$ or greater), compared with only $34 \%$ of schools statewide (see Table 4 for additional details).

Differences are also seen with respect to school size. When examining the proportion of schools with enrollments of less than 400 students, we find that $45 \%$ of schools statewide are in this size category, compared to $59 \%$ of schools in comprehensive support. Only $16 \%$ of schools in comprehensive support have 600 students or more, compared to $26 \%$ of all schools in the state.

| Table 4: Characteristics of Students in Comprehensive Support Schools Compared with All Schools Statewide |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Schools Statewide |  | Schools in Comprehensive Support |  |

| Other/not reported | NA | NA | 3 | 3.1\% |

*Demographic data based on OSPI's School Report for 2017-18.

## Key Findings Regarding Characteristics of Schools in Comprehensive Support

- A majority of schools in comprehensive support are small (enrollment less than 400 students) and primarily at the elementary level.
- Nearly $60 \%$ of schools in comprehensive support serve students where poverty rates are $75 \%$ or more compared to only $13 \%$ of schools statewide.
- Most comprehensive support schools (69\%) are schools where students of color are in the majority compared to $34 \%$ of schools statewide.

## Characteristics of Teachers in Comprehensive Support Schools

In this section, we review the characteristics of the teacher workforce statewide and in comprehensive support schools and provide some historical data for context. Approximately 65,000 teachers ${ }^{3}$ were working in Washington during the 2018-19 school year, up from approximately 49,000 in 1995. The majority of teachers in Washington are White (88\%), a statistic that has changed by only a few percentage points in more than 20 years. The proportion of teachers with less than five years of experience has grown from a fifth to a quarter of the workforce during this time. Additionally, the increase in the proportion of teachers with a Master's degree has increased by 20 percentage points. Table 5 provides details.

| Table 5: Characteristics of Washington Teacher Workforce: Changes over Time |  |  |

*Preliminary S275 duty root 31, 32, 33 or 34 with FTE designation greater than 0 in given year.

The characteristics of teachers working in comprehensive support schools differ from the statewide picture. In Table 6, we present a comparison of all teachers statewide, teachers in traditional comprehensive schools, and teachers in alternative and other types of comprehensive support schools. Across all types of comprehensive support schools, the teacher workforce is more diverse. Compared to schools statewide, traditional comprehensive support schools have a higher proportion of teachers with less than five years of experience ( $34 \%$ versus $25 \%$ ) and teachers with bachelor's degrees ( $40 \%$ versus $32 \%$ ). The teacher workforce in alternative and other comprehensive support schools is substantially different from

[^1]teachers statewide and teachers in traditional comprehensive support schools. There are higher proportions of male teachers and teachers with more years of experience in alternative and other comprehensive supports schools (see Table 6).

Table 6: Comparison of Characteristics of Washington Teacher Workforce in 2017-18 Statewide and in Different Types of Comprehensive Support Schools
$\left.\begin{array}{l|c|c|c}\hline & & \begin{array}{c}\text { Traditional } \\ \text { Comp Support } \\ \text { Schools (n=72) }\end{array} & \begin{array}{c}\text { Alternative/ } \\ \text { Other Comp } \\ \text { Support }\end{array} \\ \text { Schools (n=20) }\end{array}\right]$

## Novice Teachers

Schools in comprehensive support have higher proportions of novice teachers. Nationally and in Washington state, new teachers comprise a larger segment of the teacher workforce than in previous years. Given the state's goal to increase the racial and ethnic diversity of the teacher workforce, much of the focus has been on the preparation and hiring of new teachers of color. Nationally, $12 \%$ of all public school teachers were in their first or second year of teaching in 2014-15 (U.S. Department of Education, 2016). In Washington state in 2014-15, first- and second-year teachers comprised $10.7 \%$ of the workforce. This percentage rose to $11.7 \%$ in 2016-17 but has dropped slightly since. In the last eight years, the number of first- and secondyear teachers more than doubled from 3,387 in 2010-11 to 7,269 in 2018-19 (see Table 7).

| Table 7: Number of First and Second Year Teachers in Washington State: 2010 to 2018 |  |  |  |
| :---: | :---: | :---: | :---: |
| School Year | Total Number Teachers | Number 1st and 2nd year Teachers Statewide | Percent <br> Teachers <br> Statewide |
| 2010-11 | 56,222 | 3,387 | 6.0\% |
| 2011-12 | 55,279 | 3,668 | 6.6\% |
| 2012-13 | 55,772 | 4,314 | 7.7\% |
| 2013-14 | 56,761 | 5,336 | 9.4\% |
| 2014-15 | 58,246 | 6,261 | 10.7\% |
| 2015-16 | 59,809 | 6,918 | 11.6\% |
| 2016-17 | 61,605 | 7,204 | 11.7\% |
| 2017-18 | 63,110 | 7,081 | 11.2\% |
| 2018-19 | 64,551 | 7,269 | 11.3\% |

*Teachers with less than 2.0 years of experience
While still not a large proportion of the overall workforce, the influx of new teachers may differentially impact districts and can be a substantive issue when schools or districts experience high levels of staff turnover. It also raises questions regarding a district's ability to provide adequate support to increasing numbers of new teachers. Without adequate support, new teachers can become part of the turnover cycle. Compared to teachers statewide, teachers in traditional comprehensive support schools have a higher proportion of teachers with less than 2 years of experience ( $16 \%$ compared with $11 \%$ ), while the percent of these teachers in alternative or other comprehensive support schools are similar to the state.

Table 8: Comparison of First and Second Year Teachers in 2017-18 Statewide and in Different Types of Comprehensive Support Schools

|  | Number 1st <br> and 2nd Year <br> Teachers* | Percent 1st <br> and 2nd Year <br> Teachers |
| :--- | :---: | :---: |
| Statewide | 7,081 | $11.2 \%$ |
| Traditional Comp Support Schools (n=72) | 325 | $16.2 \%$ |
| Alternative/Other Comp Support Schools (n=20) | 26 | $11.3 \%$ |

*Teachers with less than 2.0 years of experience

## Race and Ethnicity of Beginning Teachers

When examining the race and ethnicity of beginning teachers (defined as teachers with less than one year of experience), we find that beginning teachers in comprehensive support schools are more racially and ethnically diverse than beginning teachers statewide. Three-quarters of
beginning teachers (74.5\%) in comprehensive support schools are white, compared to 82.6\% of all beginning teachers in Washington state. Furthermore, the proportion of beginning Hispanic teachers in comprehensive support schools is $15.5 \%$, which is double that of all beginning teachers in the state $(7.5 \%)$. The proportion of Native American teachers is also greater in comprehensive support schools compared to all schools in the state (3.7\% versus $0.8 \%$ ), as well as the proportion of African American teachers (3.7\% versus 2.2\%). The proportion of teachers who identify as Asian/Pacific Islander is smaller in comprehensive support schools compared to all schools in the state (see Table 9).

| Table 9: Characteristics of Beginning* <br> and in Comprehensive Support Schools in 2017/18 |  |  |
| :--- | :---: | :---: |
|  | Teachers <br> Statewide | Tchrs in Comp <br> Support <br> Schools |
| \# Teachers (Headcount) | 3,688 | 161 |
| Teacher Race/Ethnicity |  |  |
| Asian/Pacific Islander | $4.0 \%$ | $0.6 \%$ |
| Black/African American | $2.2 \%$ | $3.7 \%$ |
| Hispanic | $7.5 \%$ | $15.5 \%$ |
| Native American | $0.8 \%$ | $3.7 \%$ |
| White (non-Hispanic) | $82.6 \%$ | $74.5 \%$ |
| More than one race | $3.0 \%$ | $1.9 \%$ |
| Age in given year |  |  |
| $20-30$ | $60 \%$ | $57 \%$ |
| $31-40$ | $22 \%$ | $22 \%$ |
| $41+$ | $18 \%$ | $21 \%$ |

*Beginning teachers statewide (duty root 31, 32, 33 or 34) with FTE designation greater than 0 and based on an unduplicated count of teachers and less than 1 year of experience.

## Key Findings Regarding Characteristics of Teachers in Comprehensive Support Schools

- Teachers in comprehensive support schools are racially and ethnically more diverse than teachers statewide.
- A higher proportion of teachers (16\%) in traditional comprehensive support schools are in their first two years of teaching compared to teachers statewide (11\%).

## Retention and Mobility of Teachers

Being able to retain teachers at both school and district levels is an important factor in school improvement and in increasing access to quality instruction for students who have historically been underserved. In this section we provide analyses of the nature of teacher retention and mobility in comprehensive support schools and compare these rates to all schools statewide and to schools with comparable demographic characteristics. We also examine differences in retention and mobility rates across traditional schools in comprehensive support by size, level, and region.

## Retention and Mobility Over Five Years

We first provide some historical context by displaying the five-year retention and mobility rates of all teachers in the state over five different time periods. Over time, a slight decrease can be seen in the proportion of teachers who remain in their same school after five years, from $58 \%$ in the initial five-year period displayed (2010-11 to 2014-15) to $55 \%$ in the last three time periods examined. We also note an increase in the proportion of teachers who change districts ("movers out"), from $7 \%$ in the initial time period to $11 \%$ in the last time period (2014-15 to 2018-19). The proportion of exiters from the Washington public school system consistently remains in the range of 20-21\% (see Table 10). Our prior research on teachers who are exiters suggests that about one half of exiters are likely retirees (Elfers, Plecki \& Van Windekens, 2017).

| Table 10:Statewide Teacher Retention and Mobility: <br> Five-Year Trend Data |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Five Year Period | Stayers in <br> School | Movers in <br> District | Movers out <br> District | Exiters <br> from WA <br> system |
| 2010/11 to 2014/15 | $58 \%$ | $15 \%$ | $7 \%$ | $20 \%$ |
| 2011 -12 to 2015-16 | $57 \%$ | $14 \%$ | $8 \%$ | $21 \%$ |
| 2012 -13 to 2016-17 | $55 \%$ | $14 \%$ | $10 \%$ | $21 \%$ |
| 2013 -14 to 2017-18 | $55 \%$ | $14 \%$ | $10 \%$ | $21 \%$ |
| $2014-15$ to 2018-19 | $55 \%$ | $13 \%$ | $11 \%$ | $20 \%$ |

## Retention and Mobility in Comprehensive Support Schools

Given the context of these statewide trends, we then examine the five-year retention and mobility rates of teachers in comprehensive support schools to statewide statistics. Our analysis is focused on the most recent five-year period available (2014-15 to 2018-19). Table 11 displays the retention and mobility rates for all teachers in comprehensive support schools and also provides a breakout of rates by type of school (traditional, alternative, and other). Retention rates for teachers in comprehensive support schools are notably lower when compared to all teachers in the state. The percentage of stayers after five years is $48 \%$ in comprehensive support schools, compared to $55 \%$ statewide. This finding regarding the proportion of teachers
who are stayers also holds when examining comprehensive support schools by type. The percentage of teachers who move within their districts and out of their districts are also higher in comprehensive support schools compared to all teachers in the state. However, the percentage of all teachers in comprehensive support schools who are exiters is the same as the statewide statistic of $20 \%$. One difference appears in alternative comprehensive support schools, with an exiter rate of $27 \%$, but caution is warranted given the relatively small sample size.

In addition to the school-level retention and mobility analysis, we also examined rates for all teachers in districts that have schools in comprehensive support. When examining district-level data, we find that the retention and mobility rates are similar to statewide statistics, with the percentage of stayers at $54 \%$ compared to $55 \%$ statewide. It is important to remember that this analysis includes teachers who do not work in comprehensive support schools. We present this data because teacher retention and mobility is often discussed at the district level. However, examining district level retention rates does not accurately represent the rates of retention and movement occurring in individual schools and can mask important differences among schools in the same district. Appendix A provides a comparison of five-year district and school-level retention and mobility rates in districts with comprehensive support schools.

Table 11: Five-Year Teacher Retention and Mobility Comparison: Statewide, Districts and Schools in Comprehensive Support (2014-15 to 2018-19)

## Retention and Mobility in Traditional Comprehensive Support Schools

We also analyzed the five-year retention and mobility rates for traditional comprehensive support schools by size, level, and region. For this analysis, we only include the traditional comprehensive support schools because the numbers of alternative and other types of comprehensive support schools are too small to disaggregate across these categories.

With respect to school size, we find slightly higher percentages of stayers and lower percentages of exiters in larger schools (those with 600 or more students). There is also a somewhat higher rate of movers within districts for traditional elementary schools in comprehensive support. Retention and mobility rates are markedly different for traditional high
schools in comprehensive support, but we note that there are only two traditional high schools in this category and they are both small schools (see Table 12).

When examining difference by region of the state (Central Puget Sound ESD121, Western Washington outside of ESD 121, and Eastern Washington), we note that comprehensive support schools in Eastern Washington have a somewhat higher percentage of stayers and lower percentage of exiters as compared to the other two regions. Comprehensive support schools in ESD 121 have a higher rate of movers within district ( $21 \%$ as compared to $14 \%$ and $16 \%$ for the other two regions). The fact that ESD121 is the most densely populated of the three regions likely influences this higher rate of movement within districts. Many of these districts are larger with more opportunities to move within the district. Table 12 provides additional details regarding retention and mobility rates for traditional comprehensive support schools.

| Table 12: Five-Year Teacher Retention and Mobility Comparison: Traditional Comprehensive Support Schools (2014-15 to 2018-19) |
| :--- |

## Retention and Mobility of Beginning Teachers

As noted previously, in recent years there has been an increase in the number of beginning teachers in the state. Consequently, we analyzed the five-year retention and mobility rates for beginning teachers statewide and for beginning teachers in all comprehensive support schools. Beginning teachers in comprehensive support schools have somewhat higher rates of movement out of district ( $24 \%$ compared to $20 \%$ statewide), but lower rates of movement within their districts ( $11 \%$ compared to $14 \%$ statewide). Table 13 provides details.

Table 13: Five-Year Beginning* Teacher Retention and Mobility Comparison: Statewide and Schools in Comprehensive Support (2014-15 to 2018-19)

|  | Total <br> Number <br> Teachers | Number Beginning Teachers | Percent Beginning Teachers | Beginning Stayers in School |  | Beginning Movers in District |  | Beginning Movers out District |  | Beginning Exiters from WA system |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Number | Percent | Number | Percent | Number | Percent | Number | Percent |
| Statewide | 58,246 | 3,380 | 5.8\% | 1496 | 44\% | 460 | 14\% | 666 | 20\% | 758 | 22\% |
| Comprehensive <br> Support <br> Schools (all types) | 2,079 | 172 | 8.3\% | 73 | 42.4\% | 19 | 11\% | 42 | 24\% | 38 | 22\% |

${ }^{*}$ Teachers with less than 1.0 years of experience.

## Key Findings Regarding Five-Year Retention and Mobility

- Five-year retention rates for teachers in comprehensive support schools are notably lower compared to all teachers in the state (48\% versus 55\%).
- The percentage of teachers in comprehensive support schools who move within district and out of district are also higher than state statistics, but the percentage of exiters from the workforce is the same.
- While district-level retention and mobility for districts with comprehensive support schools are similar to the state, this masks important differences that exist among schools in the same district. Retention rates for teachers in comprehensive support schools are lower and mobility rates are higher than the rates for all teachers in their same district.

## Annual Retention and Mobility

In addition to five-year retention and mobility analyses, we also examined the retention and mobility of teachers in comprehensive support schools from one school year to the next. We first provide some historical context about the annual retention and mobility of all teachers in the state over the last five years. As can be seen in Table 14, retention and mobility rates are remarkably consistent over time, with $83 \%$ of teachers statewide remaining in their schools as teachers from one year to the next, and $7 \%$ exiting from the Washington public school system.

| Table 14: Statewide Year by Year Teacher Retention and Mobility: |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Trend Data |  |  |  |  | | Year by Year | Stayers in <br> School | Movers in <br> District | Movers out <br> District | Exiters from <br> WA system |
| :---: | :---: | :---: | :---: | :---: |
| $2013 / 14$ to 2014/15 | $82 \%$ | $7 \%$ | $3 \%$ | $7 \%$ |
| $2014 / 15$ to 2015/16 | $83 \%$ | $6 \%$ | $4 \%$ | $7 \%$ |
| $2015 / 16$ to 2017/18 | $83 \%$ | $6 \%$ | $4 \%$ | $7 \%$ |
| $2016 / 17$ to 2017/18 | $84 \%$ | $6 \%$ | $3 \%$ | $7 \%$ |
| $2017 / 18$ to 2018/19 | $83 \%$ | $6 \%$ | $4 \%$ | $7 \%$ |

We do find some differences in the year-by-year retention rates of teachers in comprehensive support schools when compared to all teachers in their districts and compared to all teachers statewide. Statewide, 83\% of teachers remain as teachers in their same schools from 2017-18 to 2018-19. This is the same statistic found for all teachers in districts that have comprehensive support schools (see Table 15). However, only $78 \%$ of teachers in comprehensive support schools of any type remain as teachers for this same time period. There is only some minor variation in retention and mobility rates for teachers across the three different types of comprehensive support schools (traditional, alternative, and other). Appendix B provides a comparison of year-by-year district and school-level retention and mobility rates in districts with comprehensive support schools.

Table 15: Teacher Retention and Mobility Comparison: Statewide, Districts and Schools in Comprehensive Support (2017-18 to 2018-19)

|  | Number Schools | Number Teachers | Stayers in School |  | Movers in District |  | Movers out District |  | Exiters from WA system |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Number | Percent | Number | Percent | Number | Percent | Number | Percent |
| Statewide | 63,100 |  | 52,651 | 83\% | 3,566 | 6\% | 2,507 | 4\% | 4,386 | 7\% |
| Comp Support Districts (55 districts) |  | 29,843 | 24,705 | 83\% | 1942 | 7\% | 1164 | 4\% | 2032 $7 \%$ <br> 170 $8 \%$ |  |
| Com Support Schools | 92 | 2,240 | 1,757 | 78\% | 203 | 9\% | 110 | 5\% |  |  |
| Comp Support Schools by Type |  |  |  |  |  |  |  |  |  |  |
| Traditional Schools | 72 | 2010 | 1,579 | 79\% | 177 | 9\% | 104 | 5\% | 150 | 7\% |
| Alternative Schools | 15 | 189 | 146 | 77\% | 22 | 12\% | 5 | 3\% | 16 | 8\% |
| Other Schools | 5 | 41 | 32 | 78\% | 4 | 10\% | 1 | 2\% | 4 | 10\% |

## Retention and Mobility in Traditional Comprehensive Support Schools

To further analyze annual teacher retention and mobility, we focus on the 72 traditional comprehensive support schools. These schools represent the majority of comprehensive support schools and have characteristics that are comparable to the majority of schools in the
state. Table 16 displays the retention and mobility rates for all teachers in traditional comprehensive support schools by size, level, and region of the state.

For the smallest traditional schools in comprehensive support, the proportion of stayers in the same school is notably lower. Only $70 \%$ of teachers in schools with less than 200 students remained in their schools as teachers from 2017-18 to 2018-19, compared to $79 \%$ in schools with enrollments from 200-600 students and compared to $80 \%$ in schools with more than 600 students. We also note a higher rate of exiters in small traditional comprehensive support schools, with an exiter rate of $15 \%$, nearly double that of schools in all other size categories. A higher proportion of teachers in traditional elementary schools also move within their districts (10\%) compared to middle schools (5\%), high schools (6\%) and other schools (7\%). This is likely due to the fact that there are more elementary schools than middle or high schools, thereby offering more opportunities for teachers to relocate within the district.

Table 16: Teacher Retention and Mobility Comparison: Traditional Comprehensive Support Schools (2017-18 to 2018-19)

|  | Number Schools | Number Teachers | Stayers in School |  | Movers in District |  | Movers out District |  | Exiters from WA system |  |

| Eastern WA | 33 | 975 | 758 | 78\% | 104 | 11\% | 49 | 5\% | 64 | 7\% |

## Comparisons to Demographically Similar Schools

We now turn our attention to a comparison of teacher retention and mobility rates in comprehensive support schools to schools with similar demographic characteristics. As described in the methodology section, we created a subgroup of traditional schools in comprehensive support that have at least 10 teachers (a total of 63 schools). We then identified a unique set of schools matched to each of these 63 traditional schools by type, level, student enrollment, and school poverty. Three unique matches were then identified for each of the 63
schools based on location, with priority given to schools within the same district, the same county, and then region of the state.

Overall, when comparing traditional comprehensive support schools to the matched schools, we find a small difference in the percentage of stayers ( $79 \%$ and $81 \%$, respectively) from 2017-18 to 2018-19. We then disaggregated the comparisons by school level and school size (see Table 17).

In six of the eight categories in which comparisons were made, schools in comprehensive support had a lower percentage of stayers than their comparison group. Two exceptions were for elementary schools with enrollments of 376-500 students ( $82 \%$ versus $79 \%$ ) and for middle schools with less than 600 students ( $87 \%$ versus $83 \%$ ).

We also find higher proportions of exiters in two cases: (1) small elementary comprehensive support schools (enrollments less than 325 students) compared to their matched comparison group ( $11 \%$ versus $7 \%$ ), and (2) larger middle schools (enrollments greater than 600 students) compared to their matched group (10\% versus 7\%).

With respect to movers in district, we find two cases in which the rates for teachers in comprehensive support schools are notably greater than for their comparison groups. The two cases are for elementary schools with enrollments of 326-375 students ( $11 \%$ versus $8 \%$ ) and for elementary schools with more than 575 students ( $16 \%$ versus $10 \%$ ). There are also differences in the high school category, but we note that there is only one traditional high school in comprehensive support in this comparison.

| Table 17: Teacher Retention and Mobility in Traditional Comprehensive Schools (>=10 Teachers) and Matched Schools in 201718 to 2018-19 |  |  |  |  |  |  |

| Matched Non-Comp | 3 | 42 | 30 71\% | 5 12\% | $25 \%$ | $512 \%$ |

## Key Findings Regarding Annual Retention and Mobility

- From 2017-18 to 2018-19, only 78\% of the teachers in comprehensive support schools remained in their school from the prior year compared to $83 \%$ of teachers statewide.
- The proportion of stayers is 10 percentage points lower for the smallest traditional schools in comprehensive support (less than 200 students) compared to teachers in other traditional comprehensive support schools. These small schools also have the highest rate of exiters.
- The majority of traditional schools in comprehensive support have somewhat lower teacher retention from one year to the next compared to a demographically similar set of schools not in comprehensive support.

## Characteristics, Retention and Mobility of Principals

In this section we examine administrative staffing in schools in comprehensive support. As mentioned earlier, these schools are situated in very diverse contexts, including among the largest and smallest districts in the state. Consequently, administrative staffing in these schools also varies based on the type of school and the number of students enrolled. In small districts, someone other than a principal may have administrative responsibilities for the school (e.g., the superintendent, other district administrator or an assistant principal). For the small subset of comprehensive support schools that provide specialized support for children and youth (e.g., reengagement or skills centers or juvenile justice institutions), we have limited data and these schools were removed from the analysis.

The majority of comprehensive support schools (86\%) had an assigned elementary or secondary principal. In four of the traditional comprehensive support schools, an assistant principal or other district administrator was listed as having administrative duties at the school. In some cases, data about administrators was lacking (Table 18 provides a breakout of this information). While larger schools also may have assistant principals, we limit the initial analysis to principals.

Table 18: Administrative Staffing in Comprehensive Support Schools in 2018-19*

*Based on preliminary S275 and administrative personnel duty codes.

## Demographic Characteristics of Principals

How are principals in comprehensive support schools similar to or different from principals statewide? In Table 19, we display the demographic characteristics of principals in comprehensive support schools compared to principals statewide in the 2018-19 school year. Similar to principals statewide, the vast majority of principals in comprehensive support schools held a master's degree or higher (92\%). A somewhat higher proportion of principals in comprehensive support schools were female ( $55 \%$ compared with $52 \%$ statewide). From our previous research, we know that a larger proportion of female principals are located at the elementary level, and given that the majority of comprehensive support schools are elementary schools, it is not surprising to see this gender difference (Plecki, Elfers \& Wills, 2017).
Principals in comprehensive support schools were somewhat more racially and ethnically diverse ( $17 \%$ persons of color compared with $11 \%$ statewide), and a higher proportion had fewer than four years of experience as an educator ( $14 \%$ compared with $8 \%$ statewide).

| Table 19: Characteristics of Washington Principals Statewide and in ComprensiveSupport Schools in 2018-19* |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Statewide |  | Comprehensive Support Schools |  |

| 5-14 years | 469 | 23.6\% | 17 | 21.8\% |
| 15-24 years | 900 | 45.3\% | 29 | 37.2\% |
| 25 yrs or more | 454 | 22.8\% | 21 | 26.9\% |

NOTE: Preliminary S275 duty roots 21 or 23 with FTE designation greater than 0 . One principal serves 2 schools and is listed only once to avoid duplication. Other administrative staff are not included in this comparison.

## Retention and Mobility Patterns of Principals and Assistant Principals

In examining the retention and mobility patterns of principals and assistant principals statewide and in comprehensive support schools and districts, we chose to use a five-year analysis of the administrator workforce. The five-year trend data provide a broader look at the stability of the workforce over time. This analysis is cohort-based, which means that we identified all principals and assistant principals (either full- or part-time) in a given year and then examined their role five years later. When looking at the most recent time period (2013-14 to 2017-18), we find that after five years, $41 \%$ of principals remained in the same school (stayers), $24 \%$ remained in the same district (movers in), and $15 \%$ moved to another district in Washington state. After 5 years, one-fifth of principals were no longer working in Washington state as a K-12 public school educator (exiters). When comparing statewide retention rates for principals during five other five-year time periods, we find strikingly similar trends. One exception is for the time period from

2000-01 to 2004-05, when a somewhat higher proportion of principals were exiters (26\%) and a lower proportion were movers in (20\%). ${ }^{4}$ See Table 20 for details.

Table 20: Five-Year Retention and Mobility Rates Statewide for Principals and Assistant Principals for Six Time Periods (2000-2017)

| 5 Year Period | Stayers |  | Movers In |  | Movers Out |  | Exiters |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Principals | APs | Principals | APs | Principals | APs | Principals | APs |
| $2000-01$ to $2004-05$ | $41 \%$ | $38 \%$ | $20 \%$ | $28 \%$ | $14 \%$ | $16 \%$ | $26 \%$ | $19 \%$ |
| $2005-06$ to $2009-10$ | $43 \%$ | $38 \%$ | $24 \%$ | $32 \%$ | $11 \%$ | $16 \%$ | $23 \%$ | $15 \%$ |
| $2010-11$ to $2014-15$ | $41 \%$ | $40 \%$ | $24 \%$ | $31 \%$ | $14 \%$ | $14 \%$ | $21 \%$ | $15 \%$ |
| $2011-12$ to $2015-16$ | $41 \%$ | $38 \%$ | $24 \%$ | $31 \%$ | $14 \%$ | $17 \%$ | $21 \%$ | $15 \%$ |
| $2012-13$ to $2016-17$ | $41 \%$ | $36 \%$ | $25 \%$ | $29 \%$ | $15 \%$ | $20 \%$ | $20 \%$ | $15 \%$ |
| $2013-14$ to $2017-8$ | $41 \%$ | $37 \%$ | $24 \%$ | $30 \%$ | $15 \%$ | $18 \%$ | $20 \%$ | $15 \%$ |

Five-year retention and mobility trends for assistant principals vary from those of principals. In general, slightly lower proportions of assistant principals remained in the same school and higher proportions move to other schools in the same district. This is not surprising as some assistant principals became principals during the time periods examined. We also found that the proportion of exiters was lower for assistant principals than principals. When examining the most recent time period (2013-14 to 2017-18), 37\% of assistant principals remained in the same school, and $30 \%$ moved to another school in the same district. This compares to $41 \%$ of principals who were stayers, and $24 \%$ who moved within the district. A higher proportion of assistant principals moved to another district (18\%) and a lower proportion were exiters (15\%) compared to principals (see Table 20).

## Retention and Mobility in Comprehensive Support Schools

We also analyzed retention and mobility rates of principals and assistant principals in schools and districts in comprehensive support for the same time period (2013-14 to 2017-18). We recognize that these schools may not have been identified for comprehensive support during that time period. However, it is important to understand the stability of administrative staffing in these schools over time. In Table 21, we provide comparisons of principal and assistant principal retention and mobility statewide in the districts where comprehensive support schools were located, and across all schools in comprehensive support. Similar to the teacher retention and mobility patterns, we see very little variation between the statewide statistics and the district statistics. Districts with schools in comprehensive support have slightly higher rates of principal and assistant principal movement within district rather than out of district, likely due to some

[^2]large districts which could offer more opportunity for administrators to change schools and remain within the district.

Table 21: Five-Year Principal Retention and Mobility Comparison: Statewide, Districts and Schools in Comprehensive Support (2013-14 to 2017-18)

|  | Number Principals /APs | Stayers in School |  | Movers in District |  | Movers out District |  | Exiters from WA system |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Number | Percent | Number | Percent | Number | Percent | Number | Percent |
| Statewide |  |  |  |  |  |  |  |  |  |
| Principals | 1,892 | 778 | 41\% | 457 | 24\% | 278 | 15\% | 379 | 20\% |
| Assistant Principals | 985 | 365 | 37\% | 291 | 30\% | 181 | 18\% | 148 | 15\% |
| Comp Support Districts |  |  |  |  |  |  |  |  |  |
| Principals | 861 | 345 | 40\% | 242 | 28\% | 103 | 12\% | 171 | 20\% |
| Assistant Principals | 501 | 186 | 37\% | 160 | 32\% | 82 | 16\% | 73 | 15\% |
| Comp Support Schools |  |  |  |  |  |  |  |  |  |
| Principals | 75 | 33 | 44\% | 18 | 24\% | 9 | 12\% | 15 | 20\% |
| Assistant Principals | 28 | 7 | 25\% | 8 | 29\% | 7 | 25\% | 6 | 21\% |

Principals in the schools currently identified for comprehensive support had slightly higher rates of staying in school (44\%) compared to principals statewide (41\%). These principals also had slightly lower rates of mobility out of district ( $12 \%$ versus $15 \%$ ). We see a different pattern for assistant principals in comprehensive support schools. Only a quarter of assistant principals in these schools remained in the same school after five years, compared to $37 \%$ for assistant principals either statewide or in comprehensive support districts. The mobility rates for the assistant principals in comprehensive support schools were higher out of district ( $25 \%$ ) and a higher proportion exited the workforce ( $21 \%$ compared with $15 \%$ statewide). While the numbers of assistant principals in the comprehensive support school group are small, the retention and mobility patterns may warrant further investigation.

## Principal Turnover in Comprehensive Support Schools

Frequent administrative changes in a school may signal leadership concerns. In order to understand changes in administrative staffing, we asked the following question: How many different lead principals did each school have during the last five years (2014-15 to 2018-19)? The analysis was based on 87 schools which reported having a principal during this time period. ${ }^{5}$ We found that about one-third of schools (32\%) had the same principal each year over the last five years. Nearly half ( $46 \%$ ) had two different principals, $17 \%$ had three principals, and four schools had four different administrators in five years (see Chart B). In the 2018-19 school year, $30 \%$ of these principals were in their first year at the school.

[^3]

## Key Findings Regarding Characteristics of Principals in Comprehensive Support Schools

- Principals in comprehensive support schools were somewhat more racially and ethnically diverse than principals statewide.
- Principals in comprehensive support schools had slightly higher five-year rates of retention than principals statewide (44\% versus $41 \%$ ).
- Assistant principals in comprehensive support schools had substantially lower five-year rates of retention ( $25 \%$ ) and higher rates of exiting the workforce ( $21 \%$ ) than assistant principals statewide ( $37 \%$ and $15 \%$ respectively).
- Nearly half (46\%) of comprehensive support schools had two principals in the last five years, and $22 \%$ had three or more principals.

## Teacher Vacancies, Recruitment and Retention

State administrative data can only address particular kinds of questions about human resources in comprehensive support schools. In order to address these limitations, we designed surveys for principals and human resource staff in schools and districts in comprehensive support. In our surveys, we asked participants to respond to items regarding teacher vacancies and how they are filled. Our inquiry about vacancies included both teaching positions that were not filled, and positions that were filled by temporary teachers (e.g. long-term substitutes, retire/rehire staff), teachers with emergency or conditional certificates, or teachers assigned to classes other than in their areas of endorsement. Survey respondents were also asked to provide information
regarding recruitment, hiring, and retention strategies at school and district levels. Additionally, we explored perspectives on efforts to diversify the educator workforce, the types of supports that principals receive, and the nature of the workload for HR staff.

When making comparisons between the responses of principals and HR staff, it is important to be aware that principals were reporting on the group of teachers in their schools, while HR staff were responding about districtwide conditions. It is also important to note that principals who responded to the survey were not necessarily located in the districts that HR staff represent. With those distinctions in mind, we discuss our analysis and findings from the survey data below.

## Teacher Vacancies and How They are Filled

One-quarter of principals (25\%) and nearly one third (32\%) of HR staff reported having at least one classroom teaching position that was not filled when the 2018-19 school year began. Principals reported that $30 \%$ of these unfilled positions at their building were in elementary education, $20 \%$ in special education, $20 \%$ in bilingual education, $20 \%$ in science, and $10 \%$ in English/language arts. HR staff reported some similar results for their districts, with $32 \%$ of unfilled positions in elementary education, 29\% in special education, and 10\% in English/language arts. However, the responses from HR also reveal some differences, with reports of only $4 \%$ of the districts' unfilled positions in bilingual education and $4 \%$ in science, while $14 \%$ of vacancies were in music and art and $7 \%$ were in world languages. Table 22 displays this data regarding unfilled positions.

| Table 22: Type of Teaching Position Unfilled on the First Day |
| :--- | :---: | :---: |
| of School |

Of the principals who reported having at least one classroom teaching position unfilled when the school year began, $30 \%$ reported having at least one position still unfilled on February 1. Additionally, one-third of all principal respondents agreed that their inability to hire caused them to make changes to the school schedule or program to adjust to hiring difficulties. When asked to describe the kinds of changes that were made because of unfilled positions, principals described a number of strategies. Some indicated they combined classes (e.g., created a $2^{\text {nd }} / 3^{\text {rd }}$ grade split class), reduced electives, changed the instructional delivery method, or increased the size of intervention classes. One principal stated that the school no longer has a music or art
program due to inability to hire, while another used a part-time music teacher to fill a half-time classroom teaching position vacancy, thereby reducing music offerings at the school. Some principals stated that they had to use intervention teachers to fill classroom teaching roles at times when no substitutes were available. Another principal described the following circumstances regarding vacancies:

Last year we spent the entire fall semester missing a kindergarten teacher. Also, in November one of our new hires decided to quit. We had to fill these two positions one day at a time with substitutes or with other staff members rotating in (interventionist, coach, PE teacher, etc.) until we were able to hire new teacher education program graduates in January.

In addition to vacancies at the start of the school year, $68 \%$ of HR staff reported having at least one teaching position in the district become vacant during the school year. Nearly a third (31\%) of HR staff who had such vacancies reported that the vacancies were for 10 or more teaching positions, with one HR staff member reporting 80 such vacancies in the district.

In addition to positions that are unfilled, we also inquired about other types of vacancies in comprehensive support schools. These types include positions filled by teachers who lack full credentials and those in temporary teaching positions. Of the principals who responded to this item, more than a third (36\%) reported having at least one teacher with a conditional certificate and more than one quarter ( $28 \%$ ) had at least one teacher with an emergency certificate. With respect to temporary teachers, $25 \%$ of principals indicated having at least one teacher who is a long-term substitute and $14 \%$ reported having at least one teacher who is a retire/rehire staff member. Additionally, nearly a third (31\%) of principals indicated that they had at least one teacher assigned to teach in areas other than in their endorsement(s). Table 23 provides details.

| Table 23: Principals Reporting at Least One Teacher Who Is Temporary <br> or Lacking Full Credentials <br> $(\mathrm{n}=36)$ |  |  |
| :--- | :---: | :---: |
| Type of Credential | Number of <br> Principals | Percent of <br> Principals |
| Individuals with a conditional certificate | 13 | $36 \%$ |
| Certificated teachers assigned to classes <br> other than in their areas of endorsement | 11 | $31 \%$ |
| Individuals with an emergency credential | 10 | $28 \%$ |
| Long-term substitutes | 9 | $25 \%$ |
| Retire/rehire | 5 | $14 \%$ |

At the district level, a higher proportion of these types of teachers (47\%) had a conditional certificate and a lower proportion (10\%) were long-term substitutes (see Table 24). As previously mentioned, it is important to keep in mind that the reports of principals and HR staff
are not directly comparable, as principals are only reporting on the teachers in their schools, while HR staff are characterizing teachers throughout the district.
$\left.\begin{array}{l|c|c}\hline \text { Table 24: Comparison of Principals and HR Staff Reporting about Teacher } \\ \text { Credentials }\end{array} \left\lvert\, \begin{array}{c}\text { Percent } \\ \text { Reported by } \\ \text { Principals }\end{array} \begin{array}{c}\text { Percent } \\ \text { Reported by } \\ \text { HR staff }\end{array}\right.\right]$

The final aspect of our inquiry regarding vacancies examines the types of teaching positions that are perceived as hardest to fill. Principals and HR staff were asked to rank order the top three teaching positions they believe are hardest to fill in their districts and schools. By far, both principals and HR staff identified special education positions as the hardest to fill, with $63 \%$ of principals and $68 \%$ of HR staff selecting this as their first choice. As second choices, $20 \%$ of principals identified elementary education, while $37 \%$ of HR staff selected mathematics as their second choice. Both principals (23\%) and HR staff (16\%) chose bilingual education/dual language as their third choice, with another $16 \%$ of HR staff selecting mathematics as the third choice (see Table 25).

Table 25: Rank Ordering of Teaching Positions that are Most Difficult to Fill

|  | 1st Choice | 2nd Choice | 3rd Choice |
| :--- | :--- | :--- | :--- |
| Principals | Special Ed | Elementary Ed | Bilingual/ Dual Lang |
|  | $63 \%$ | $20 \%$ | $23 \%$ |
| HR Staff | Special Ed <br> $68 \%$ | Mathematics <br> $37 \%$ | Bilingual/ Dual Lang <br> Mathematics <br> $16 \%$ each |

## Key Findings Regarding Teacher Vacancies and How They are Filled

- Twenty-five percent of principals in comprehensive support schools and $32 \%$ of human resource staff in these districts report having at least one classroom teaching position that was not filled when the 2018-19 school year began. Thirty percent of these principals reported having at least one position still unfilled on February $1^{\text {st }}$.
- One-third of all principals agreed that their inability to hire caused them to make changes to the school schedule or program to adjust to hiring difficulties.
- More than a third of principals reported having at least one teacher with a conditional certificate, and more than one-quarter had at least one teacher with an emergency certificate.
- Nearly a third of principals had at least one teacher assigned to classes other than in their areas of endorsement.
- Both principals and HR staff identified special education as the hardest teaching position to fill. Other areas both principals and HR staff noted as hard to fill include mathematics and bilingual/dual language education. Elementary education was identified by principals as hard to fill.

## Recruitment and Hiring Strategies

Recruiting and hiring teachers who are best suited to meet the needs of students in a district or school is a vital responsibility shared by HR staff and principals (Simon et al., 2019). In this section, we discuss the views of HR staff and principals regarding strategies for advertising and hiring, timing of offers, prevalence and effectiveness of specific recruitment strategies, and perceived obstacles to finding desirable candidates.

## Advertising and Hiring

From the survey data, we find that there is considerable variation in district-level practices regarding the timing of advertising and making offers to prospective teachers. About one-third (32\%) of HR staff reported that their districts begin advertising for teaching openings in the upcoming school year prior to March 1, while 21\% indicated that their districts begin advertising April 30 or later. With respect to making offers of employment, $32 \%$ of HR staff reported making offers on March 15 or earlier, while $42 \%$ make offers May 1 or later. A number of factors can influence the timing decisions made by districts, including student enrollment, teacher turnover, and the proportion of teachers who are either new or retiring, any of which could influence the timing of advertising and offers.

HR staff were asked to describe the types of strategies and sources of district advertising for open teaching positions. When asked about advertising in various media outlets, all HR staff indicated that they advertise on the district web site. A majority of HR staff report that their
district always or often advertises on the ESD website (74\%) or on social media or other internet outlets ( $63 \%$ ). However, there were other strategies that were used less frequently. The majority of HR staff reported not using trade publications (53\%), radio (79\%) or television (84\%) (see Table 26). A majority of HR staff ( $68 \%$ ) also report advertising with teacher preparation programs.

Table 26: Frequency of Advertising for Openings by Type of Media Outlet (HR staff $=19$ )

|  | Always | Often | Occasionally | Not at all |
| :--- | :---: | :---: | :---: | :---: |
| District website | $90 \%$ | $11 \%$ | $0 \%$ | $0 \%$ |
| ESD website/other | $21 \%$ | $16 \%$ | $37 \%$ | $16 \%$ |
| communications | $16 \%$ | $47 \%$ | $21 \%$ | $11 \%$ |
| Social media/other internet outlets | $16 \%$ | $32 \%$ | $26 \%$ | $16 \%$ |
| Professional associations | $5 \%$ | $21 \%$ | $47 \%$ | $21 \%$ |
| Newspapers | $0 \%$ | $0 \%$ | $37 \%$ | $53 \%$ |
| Trade publications (e.g., EdWeek) | $0 \%$ | $0 \%$ | $11 \%$ | $79 \%$ |
| Radio | $0 \%$ | $0 \%$ | $5 \%$ | $84 \%$ |
| Television |  |  |  |  |

Since the hiring of teachers involves interactions at both district and school levels, we inquired about practices regarding who is involved in hiring and how applications are processed. Again, we find variation in district practices. The majority of HR staff ( $58 \%$ ) strongly agree that principals are the key decision-makers in hiring teachers for their schools, and another 21\% somewhat agree with this statement. Principals' responses also reflect some variation regarding how involved they are with hiring teachers at their schools. While the majority of principals either strongly agree (53\%) or somewhat agree (28\%) that they have sufficient autonomy to hire teachers they believe are best qualified for their school, one-fifth ( $20 \%$ ) either strongly or somewhat disagree. The majority of HR staff ( $68 \%$ ) strongly or somewhat agree that their district hiring process is centralized. Slightly more than a quarter ( $26 \%$ ) of HR staff and $22 \%$ of principals either strongly or somewhat disagree that the hiring process is centralized.

When asked about how prospective teachers apply for employment in the district, most HR staff ( $79 \%$ ) indicated that candidates can only submit applications online, with another $21 \%$ indicating that applications can be submitted online or in hard copy. The vast majority of HR staff ( $90 \%$ ) strongly agree that their districts have an online system for tracking applicants, and all HR staff either strongly ( $74 \%$ ) or somewhat ( $26 \%$ ) agree that applications can be shared electronically with principals and others. However, the majority of principals either strongly disagree (31\%) or somewhat disagree (22\%) that they have easy online access to all teacher candidates.

A small proportion of HR staff reported that applications can be submitted even when there are no advertised openings, and slightly more than one-quarter of HR staff (26\%) indicated that that applicants can apply to a general teaching pool. Nearly half of HR staff (47\%) reported that the
district offers incentives for early notification of upcoming retirements. This practice is often used to help districts plan earlier for the projected number of openings in teaching positions due to retirement.

Principals were asked about their experiences and preferences regarding hiring, including the interview process. While the majority of principals (72\%) agreed that they have sufficient time to hire new staff before the beginning of the school year, more than a quarter ( $28 \%$ ) disagreed with this statement, and slightly more than a third of principals (34\%) disagree that HR provides clear information about the timeline and hiring process in their districts. The majority of principals ( $69 \%$ ) agree that they spend a considerable amount of time searching for qualified applicants for their schools, and also agree (64\%) that HR supports them in identifying the best-fit candidates. With respect to interviews, the overwhelming majority of principals (94\%) agree that the interview team consists primarily of individuals from their schools. However, two-thirds of principals (66\%) disagree that the interview team includes sufficient input from community members. The vast majority of principals (94\%) indicated that they prefer to hire teachers who have prior experience working with diverse student populations, while a smaller proportion (52\%) say they prefer applicants who are from the community over applicants from other districts or states. Table 27 provides details regarding the views of principals about the hiring process.

Table 27: View of Principals about the Hiring Process ( $n=36$ )

|  | Strongly <br> Disagree | Somewhat <br> Disagree | Somewhat <br> agree | Strongly <br> Agree |
| :--- | :---: | :---: | :---: | :---: |
| I prefer to hire teachers who have prior experience <br> working with diverse student populations | 0 | $6 \%$ | $36 \%$ | $58 \%$ |
| The interview team consists primarily of individuals <br> from my school | 0 | $6 \%$ | $22 \%$ | $72 \%$ |
| I have sufficient autonomy to hire teachers who are <br> best qualified to teach in my school | $6 \%$ | $14 \%$ | $28 \%$ | $53 \%$ |
| I have sufficient time to hire new staff before the <br> beginning of the school year | $6 \%$ | $22 \%$ | $50 \%$ | $22 \%$ |
| I spend a considerable amount of time searching for <br> qualified applicants for my school | $3 \%$ | $28 \%$ | $22 \%$ | $47 \%$ |
| HR provides clear information about the timeline and <br> hiring process | $6 \%$ | $28 \%$ | $22 \%$ | $44 \%$ |
| HR supports me in identifying the best-fit <br> candidates | $11 \%$ | $25 \%$ | $42 \%$ | $22 \%$ |
| I prefer applicants who are from our community over <br> applicants from other districts or states | $8 \%$ | $39 \%$ | $33 \%$ | $19 \%$ |
| I have easy online access to all teacher candidates <br> who have applied to the district | $31 \%$ | $22 \%$ | $8 \%$ | $39 \%$ |
| The interview team includes sufficient input from <br> community members | $39 \%$ | $28 \%$ | $25 \%$ | $8 \%$ |

## Key Findings Regarding Advertising and Hiring for Teaching Positions

- One-third of HR staff report that they begin advertising prior to March 1, and 21\% begin advertising April $30^{\text {th }}$ or later.
- Thirty-two percent of HR staff reported making offers of employment by March 15 or earlier, while 42\% make offers May 1 or later.
- While $90 \%$ of HR staff agree that their districts have an online system for tracking applicants, the majority of principals (53\%) disagree that they have easy online access to all teacher candidates.
- The majority of principals ( $94 \%$ ) agree that the interview team consists mostly of individuals from their schools, but two-thirds of principals disagree that the interview team includes sufficient input from community members.

## Recruitment Strategies and their Effectiveness

We asked principals and HR staff about the types of incentives and recruitment strategies employed at district and school levels, and gathered their perceptions of the effectiveness of the various recruitment strategies being used.

HR staff were asked to identify the types of financial recruitment incentives that are offered to prospective teachers. The majority of HR staff (53\%) indicated that additional compensation was offered for extracurricular or administrative functions, and $42 \%$ noted that financial support was offered for pursuing National Board certification. Smaller proportions of HR staff indicated the following incentives were offered: loan forgiveness (26\%), flexibility in crediting teaching experience in other districts or states (26\%), signing bonus (21\%), tuition support for completing a credential or endorsement ( $21 \%$ ), and flexibility in crediting job experience in non-teaching occupations (11\%). Only one HR staff member responding to the survey indicated that additional compensation was offered for teaching in hard-to-staff fields, and no one indicated that additional compensation was provided for teaching in high-poverty schools (see Table 28). When HR staff were asked to describe supports that would help them be more effective in their roles, one survey participant identified "the ability to offer incentives to candidates hired to fill hard-to-fill positions." A principal shared a similar perspective, "It is difficult to recruit teachers to rural and high poverty schools. I think some kind of bonus or stipend would be a big incentive for teachers to come to these areas."

Table 28: Human Resource Staff Reports of District Recruiting Incentives ( $\mathrm{n}=19$ )

|  | Number | Percent |
| :--- | :---: | :---: |
| Additional compensation for extracurricular or administrative <br> functions | 10 | $53 \%$ |
| Financial support for pursuing National Board certification | 8 | $42 \%$ |
| Flexibility in crediting teaching experience in other districts or <br> states | 5 | $26 \%$ |
| Loan forgiveness | 5 | $26 \%$ |
| Tuition support for completing a credential or endorsement | 4 | $21 \%$ |
| Signing bonus (one-time payment) | 4 | $21 \%$ |
| Flexibility in crediting job experience in non-teaching | 2 | $11 \%$ |
| occupations | 1 | $5 \%$ |
| Additional compensation for teaching in hard-to-staff fields | 0 | 0 |

In addition to offering incentives, a variety of other recruitment strategies are used at district and school levels. Principals and HR staff were asked about the use and effectiveness of particular recruitment strategies. The vast majority of principals reported using the following strategies to
recruit teachers for their schools: encouraged paraeducators to pursue a career in teaching (92\%), informally networked to identify prospective candidates (92\%), attended regional job fairs ( $89 \%$ ), encouraged student teachers to apply ( $86 \%$ ), and contacted district HR to identify a pool of applicants $(86 \%)$. However, principals rated some of these prevalent strategies to be more effective than others. For example, $94 \%$ of principals rated informal networking to identify prospective candidates as either very effective (39\%) or somewhat effective (55\%). On the other hand, only $15 \%$ of principals rated encouraging paraeducators to become teachers as very effective, and $30 \%$ indicated that it was ineffective. Similarly, while most principals (89\%) indicated that they attended regional job fairs, only $3 \%$ rated this as very effective, and $38 \%$ rated this as ineffective (see Table 29). One principal provided a suggestion regarding how to improve the effectiveness of recruiting paraeducators to become teachers:

Provide alternative ways to meet the basic skills test and content specific test. For example, a para-educator with 5 or more years of experience should be able to use their experience to help meet the education program requirement. A portfolio of work would be a viable alternative to the content specific test. The reality is that a basic skills tests or a content specific test should not be the determining factor for a person to receive certification in teaching.

Another principal echoed this perspective, noting that "we need to make certain that the West-B and the West-E tests are not the ultimate gatekeepers."

| Table 29: Principals' Views of the Effectiveness of Strategies Used to Recruit Teachers in Their School ( $\mathrm{n}=36$ ) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Used this Strategy | Very Effective | Somewhat Effective | Not Effective |
| Attended regional job fairs | 89\% | 3\% | 59\% | 38\% |
| Traveled to recruit teachers out of state | 22\% | 13\% | 50\% | 38\% |
| Direct contact with teacher preparation programs | 72\% | 27\% | 58\% | 15\% |
| Encouraged student teachers to apply for positions in my school | 86\% | 19\% | 74\% | 7\% |
| Encouraged paraeducators in my school to pursue a teaching credential | 92\% | 15\% | 55\% | 30\% |
| Encouraged teachers to transfer from other schools or districts to my school | 58\% | 14\% | 67\% | 19\% |
| Contacted the district human resources department to identify a pool of applicants | 86\% | 23\% | 52\% | 26\% |
| Started recruiting before positions were formally posted by the district | 75\% | 15\% | 82\% | 4\% |
| Informally networked to identify prospective candidates | 92\% | 39\% | 55\% | 6\% |

All HR staff report using the following four recruitment strategies: regional job fairs, hiring teachers from alternative route programs, supporting paraeducators to become teachers, and advertising positions online, in print, or other media. Of these four strategies, the one rated as most effective was supporting paraeducators to become teachers. All HR staff rated this as either very effective (39\%) or somewhat effective (61\%), which contrasts with only $15 \%$ of principals who rated this as very effective and $30 \%$ who indicated it was not effective. Additionally, $95 \%$ of HR staff reported encouraging student teachers to apply for positions, with $41 \%$ of these staff rating and no one rated this strategy as ineffective. Only a small proportion of HR staff reported using the following three strategies: hiring teachers from outside the United States (32\%), providing signing bonuses (32\%), and providing financial incentives for teaching in hard to staff or high poverty schools (26\%). Of those who used these three strategies, 50\% rated hiring teachers from outside the United States as ineffective, and a third rated providing financial incentives for teaching in hard to staff or high poverty schools as ineffective.

## Obstacles to Finding Desirable Candidates

A sizable portion of HR staff (43\%) disagreed, either strongly or somewhat, that the pool of teaching applicants meets the needs of their districts, and an even larger proportion of principals ( $59 \%$ ) disagreed that the pool of teaching candidates available to them meet the needs of their schools. When asked about the level of difficulty in recruiting certificated teachers with appropriate endorsements in their districts over the last three years, $21 \%$ of HR staff indicated it was very difficult, $42 \%$ reported that it was somewhat difficult, and $32 \%$ said it was a little difficult.

More than four-fifths of principals ( $81 \%$ ) indicated that a lack of well-qualified candidates was either a major or moderate obstacle to finding desirable candidates for their schools, and nearly half (48\%) indicated that the lack of amenities other towns and cities can provide was a major or moderate obstacle. A sizable portion of principals indicated that the following factors presented major or moderate obstacles to finding desirable candidates: salary and benefits greater in other districts (45\%), district transfer policies that reduce flexibility to choose prefer candidates (44\%), and lack of affordable housing (44\%). Smaller proportions of principals noted that lack of childcare options ( $38 \%$ ), long commutes to and from work ( $30 \%$ ), and lack of proximity to a teacher preparation institution (25\%) presented either major or moderate obstacles. A majority of principals (56\%) reported that restrictions on hiring teachers with out-of-state credentials and lack of an ability to offer a full-time position were not obstacles to finding desirable candidates (see Table 30 for details).

Table 30: Principals' Views of Obstacles to Finding Desirable Candidates ( $n=36$ )

|  | Not an <br> obstacle | Small <br> obstacle | Moderate <br> obstacle | Major <br> Obstacle |
| :--- | :---: | :---: | :---: | :---: |
| Lack of well-qualified applicants | $8 \%$ | $8 \%$ | $31 \%$ | $50 \%$ |
| Lack of amenities that other towns and cities <br> can offer | $36 \%$ | $14 \%$ | $17 \%$ | $31 \%$ |
| Salary or benefits are greater in other districts | $36 \%$ | $17 \%$ | $14 \%$ | $31 \%$ |
| District transfer policies that reduce my <br> flexibility to choose the candidates I prefer | $25 \%$ | $28 \%$ | $19 \%$ | $25 \%$ |
| Lack of affordable housing | $36 \%$ | $17 \%$ | $19 \%$ | $25 \%$ |
| Lack of child care options | $28 \%$ | $31 \%$ | $19 \%$ | $19 \%$ |
| The commute to and from work is too long | $33 \%$ | $33 \%$ | $11 \%$ | $19 \%$ |
| Lack of proximity to a teacher preparation <br> institution | $42 \%$ | $31 \%$ | $19 \%$ | $6 \%$ |
| Lack of ability to offer a full-time position | $56 \%$ | $28 \%$ | $6 \%$ | $8 \%$ |
| Restrictions on hiring teachers with out-of- | $56 \%$ | $31 \%$ | $3 \%$ | $6 \%$ |
| state credentials |  |  |  |  |

Responses from HR staff regarding finding desirable candidates for their districts largely mirror the responses from principals, with the exception that a much larger proportion of HR staff $(84 \%)$ indicated that salary or benefits that are greater in other districts was a major or moderate obstacle, compared to $44 \%$ of principals who felt similarly.

## Key Findings Regarding Recruitment Strategies and Their Effectiveness

- Nearly all principals (94\%) rated informal networking to identify prospective candidates as effective. However, only $15 \%$ of principals rated encouraging paraeducators to become teachers as very effective and $30 \%$ rated it as ineffective.
- Most principals (89\%) indicated that they attended regional job fairs but only $3 \%$ rated this as very effective, and $38 \%$ indicated it was ineffective.
- Only one HR staff member indicated that additional compensation was offered for teaching in hard to staff fields and no one indicated that additional district compensation was provided for teaching in high poverty schools.
- The majority of principals ( $81 \%$ ) indicated that the lack of well-qualified candidates was an obstacle to filling positions in their schools. Other obstacles noted by principals were lack of amenities that other towns and cities can offer (48\%) and salary and benefits that are greater in other districts (45\%).

## Retention Strategies

A factor equal in importance to teacher recruitment is teacher retention. We asked principals and HR staff about the kinds of strategies they find to be important in retaining the teachers they want to keep in their schools and districts. The top three strategies that principals rated as "very important" in retaining teachers in their schools were: (1) opportunities for effective teacher collaboration, (2) high quality professional learning opportunities, and (3) high quality mentoring for new teachers. When also considering the rating of "somewhat important," $92 \%$ of principals rated these three strategies as very or somewhat important. The vast majority of principals also rated the following strategies as very or somewhat important: teacher leadership opportunities (94\%), adequate classroom supplies and materials (92\%), supports for teachers who wish to earn additional endorsements (86\%), positive discipline or restorative justice programs (83\%), adequate classroom facilities ( $83 \%$ ), and supports for teachers to pursue National Board certification (82\%). Nearly half of principals (47\%) rated job-sharing options as not important, while a third of principals indicated that school-wide family engagement programs were not important in retaining teachers in their schools (see Table 31).

| Table 31: Principals' Views of the Importance of Teacher Retention Strategies ( $\mathrm{n}=36$ ) |  |  |  |
| :---: | :---: | :---: | :---: |
|  | Very Important | Somewhat Important | Not Important |
| Opportunities for effective teacher collaboration | 67\% | 25\% | 8\% |
| High quality professional learning opportunities | 64\% | 28\% | 8\% |
| High quality mentoring for new teachers | 61\% | 31\% | 6\% |
| Teacher leadership opportunities | 47\% | 47\% | 6\% |
| Adequate classroom supplies and materials | 42\% | 50\% | 6\% |
| Positive discipline or restorative justice programs | 36\% | 47\% | 11\% |
| Adequate classroom facilities | 36\% | 47\% | 14\% |
| Supports for teachers to pursue National Board Certification | 28\% | 53\% | 11\% |
| Supports for teachers who wish to earn additional endorsements | 25\% | 61\% | 11\% |
| School-wide family engagement programs | 17\% | 44\% | 33\% |
| Job-sharing options | 8\% | 36\% | 47\% |

HR staff were asked to assess district-level factors that may contribute to why their districts lose teachers they would like to retain, and their perspectives differed somewhat from those of principals. Nearly four-fifths (79\%) indicated that retirements and lack of job-sharing options
were either major or minor reasons why teachers were leaving, and nearly three-fourths (73\%) identified the lack of affordable housing and the commute to and from work as either a major or a minor reason. The majority of HR staff ( $74 \%$ ) indicated that the lack of opportunities for professional growth was not a reason for the loss of teachers.

## Diversity and Equity of Supports

Principals and HR staff were also asked to share their perspectives regarding efforts to attract and retain a more diverse teaching staff and their views on how schools in comprehensive support and Title 1 schools are supported. The majority of principals (83\%) either strongly (14\%) or somewhat (69\%) agree that diversifying the teacher workforce is a priority of the district. One principal shared the following viewpoint about what should be done to diversify the workforce:
"First, the district office must consider this a priority for school improvement efforts in my district. I do not believe they do. Little to no training is provided for leaders in my district to do this effectively."

While the majority of HR staff (63\%) agreed that the district has specific strategies to attract a more diverse educator workforce, only one-quarter (26\%) strongly agreed with this statement. One HR staff member described the challenge as follows: "We are developing specific strategies around retention plans. When I ask around, I am not finding sample plans centered on the retention of teachers of color. I would appreciate technical assistance and samples of such plans." A similar percentage of HR staff (64\%) agreed that the district has made substantial improvements in diversifying the teacher workforce, and only $11 \%$ strongly agreed. Nearly one third (31\%) either strongly or somewhat disagreed that substantial improvements had been made. One HR staff member wrote, "...the district must deliver on the promise of a more diverse, inclusive, and equitable place to work in order to retain teachers of color." Several HR staff members noted the important role of teacher preparation programs. One indicated that "more diversity in college teacher preparation programs would provide more diversity to school districts." Another HR staff noted, "better and more diverse teacher preparation programs; we are so geographically remote that it becomes quite difficult to diversify."

A principal provided an additional perspective on what needs to be done to attract and retain a more diverse educator workforce:

As an educator, I looked to teach in a district/school environment which valued my skills and provided the resources needed to improve my teaching skills and also valued my bilingual abilities and multicultural background. Creating school cultures where staff feel that they can learn and grow their skills is crucial in retaining staff. Staff is more willing to teach in a school system which is supportive of staff and students by providing adequate resources and systems of support.

More than half of HR staff (54\%) somewhat agreed and another $21 \%$ strongly agreed that the district has a teacher recruitment strategy that is focused on the needs of Title 1 schools and
schools in comprehensive support. Smaller proportions of principals somewhat agreed (44\%) or strongly agreed (14\%). While 64\% of principals either strongly or somewhat agreed that the district attends to the needs of schools in an equitable fashion, more than one third of principals (35\%) disagreed. When asked whether district HR is effective in helping them staff their schools, $42 \%$ of principals strongly agreed, $31 \%$ somewhat agreed, and $28 \%$ either strongly or somewhat disagreed.

Principals in comprehensive schools were also asked about other types of supports they receive. While the majority of principals ( $69 \%$ ) agreed that they have adequate supports for working with teachers whose job performance is not satisfactory, nearly a third ( $31 \%$ ) disagreed. A larger proportion of principals (86\%) agreed that the district provides sufficient support for the induction and mentoring of new teachers. Table 32 provides details from principals' responses regarding supports for their schools.

| Table 32: Principals' Views Regarding District HR Support ( $\mathrm{n}=36$ ) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Strongly <br> Disagree | Somewhat <br> Disagree | Somewhat <br> Agree | Strongly <br> Agree |
| The district provides sufficient support for <br> induction and mentoring of new teachers | 0 | $14 \%$ | $44 \%$ | $42 \%$ |
| District HR is effective in helping staff my school | $6 \%$ | $22 \%$ | $31 \%$ | $42 \%$ |
| I have adequate supports for working with <br> teachers whose job performance is not <br> satisfactory | $3 \%$ | $28 \%$ | $50 \%$ | $19 \%$ |
| The district attends to the needs of schools in <br> an equitable fashion | $11 \%$ | $25 \%$ | $33 \%$ | $31 \%$ |
| The district has a teacher recruitment strategy <br> that is focused on the needs of Title I schools <br> and schools in comprehensive support | $22 \%$ | $19 \%$ | $44 \%$ | $14 \%$ |

## Nature of Human Resource Responsibilities

As described previously, districts that have schools in comprehensive support vary in size, location, type (urban, rural, or suburban), and in the demographic characteristics of the students being served. Consequently, it is not surprising that personnel working in HR systems within districts will vary in the size and scope of their work responsibilities. We inquired about the types of responsibilities that HR staff have, the number of staff supporting HR functions, their workload, and the types of supports they receive.

As discussed previously in the methods section, it is important to remember that that there is an over-representation of HR staff working in small districts (enrollment less than 1,000 students) compared to all districts that have comprehensive support schools. Among our survey respondents, just $37 \%$ have HR functions as their only work responsibilities. Additionally, only
$42 \%$ of respondents reported spending more than $80 \%$ of their time on HR responsibilities, with $37 \%$ indicating that they spend only $50 \%$ or less of their time on HR duties. Nearly a third (32\%) were the only HR staff in the district, and another third ( $32 \%$ ) have only 2 staff responsible for HR functions. In our sample of HR staff, $15 \%$ reported having more than 10 staff members with district HR responsibilities. A principal who responded to an open-ended survey item noted the need for the district to improve HR staffing as follows: "In our district, we need to hire a Director/person to lead HR rather than making it an add-on position to the Deputy Superintendent. We have 24 sites and over 13,000 students."

A sizeable portion of HR staff (42\%) have financial management responsibilities in addition to HR functions, $16 \%$ report having responsibility for facilities management, and $10 \%$ report responsibilities for special education or curriculum and instruction. The majority of survey respondents also report having responsibility for the following HR-related functions: onboarding of new hires ( $90 \%$ ), recruitment and hiring ( $79 \%$ ), benefits ( $79 \%$ ), collective bargaining ( $68 \%$ ), and labor relations (68\%). Approximately half of HR staff (53\%) report responsibilities for teacher and principal evaluation or beginning teacher support. Another aspect of variation among HR staff involves the number of teachers hired by the district. Nearly half (47\%) of HR staff reported hiring at least 20 teachers this past school year, with $26 \%$ hiring more than 100 teachers. One survey respondent indicated that the district hired over 400 teachers this past school year.

## Key Findings Regarding Teacher Retention Strategies

- The top three retention strategies that principals rated as very important were opportunities for effective teacher collaboration, high quality professional learning opportunities, and high quality mentoring for new teachers.
- Fifty-eight percent of principals agreed that the district has a teacher recruitment strategy focused on the needs of Title 1 and comprehensive support schools, but $38 \%$ felt that the district does not attend to the needs of schools in an equitable fashion
- Nearly a third of HR staff (31\%) disagreed that the district had made substantial improvements in diversifying the workforce.
- Thirty-two percent of HR staff reported that they were the only HR staff member in the district, and 42\% report having financial management responsibilities in addition to HR responsibilities.

## Discussion and Implications

Schools in comprehensive support struggle to meet expectations for their students. In seeking to assist schools identified for support and improvement, it can be helpful to understand the specific staffing challenges which these schools may face. Washington state's 98 comprehensive support schools are a small subset of the state's diverse public educational institutions. In this report we examined teacher and principal workforce characteristics in these schools, as well as retention and mobility patterns. We also investigated how these schools, and the districts in which they are situated, seek to address staffing concerns such as vacancies, recruitment and hiring. In this concluding section of the report, we discuss major themes and findings from the study, and suggest implications for supporting the staffing needs of these schools.

## 1. Comprehensive support schools are different from most schools statewide in important ways, particularly with respect to the students served and the retention and mobility patterns of their teachers and principals.

Most of the schools identified for comprehensive support would be regarded as traditional public schools. However, they also include alternative schools, re-entry schools and other facilities that offer specialized care for children and youth. The majority of the schools are small (enrollment less than 400 students) and more than half are elementary schools. Nearly all serve a larger proportion of students in poverty and students of color than schools statewide. While their teaching staff are more racially and ethnically diverse, proportionately more of these teachers are new to the profession with fewer years of experience.

Overall, teachers in comprehensive support schools have lower retention rates in their schools than teachers statewide, and lower retention rates as compared to other teachers in their districts. These patterns are important to recognize because higher staff turnover has been shown to have detrimental impacts on student outcomes (Loeb, Kalogrides \& Beteille, 2012). The teachers who leave these schools are not necessarily leaving the state's teacher workforce. Instead, teacher retention in comprehensive support schools is low because, in many cases, these teachers either move to other schools within the same district or other schools in the state. These patterns hold when we examined data for comprehensive support schools over both five-year and year-by-year time periods. Aggregate district-level retention and mobility rates for districts with comprehensive support schools tend to be similar to the state and mask important differences that exist among schools within the same district. This is one reason why it is important to look at individual school-level data, especially with regard to comprehensive support schools.

For a closer comparison of traditional comprehensive schools, we identified a unique matched set of demographically similar schools. In most cases, comprehensive support schools had somewhat lower rates of teacher retention than their matched counterparts. While the differences were smaller in comparison to statewide statistics, this is not unexpected given that
the matched schools serve similar student populations and may also face staffing challenges which require additional support.

Administrative staffing in comprehensive support schools reflects the diversity of their school contexts. The majority of comprehensive support schools have an assigned principal or assistant principal, but in small districts and in specialized institutions someone other than a principal may have administrative responsibilities (e.g., superintendent or other district administrator). Principals in comprehensive support schools are somewhat more racially and ethnically diverse than principals statewide.

Principals in these schools have retention rates similar to principals statewide, but assistant principals in comprehensive support schools had substantially lower five-year rates of retention and a higher rate of exiting the workforce than assistant principals statewide. Nearly half of comprehensive support schools had two principals in last five years, and over one-fifth had three or more principals. School leadership turnover may have an impact on instructional improvement efforts in schools (Hitt, Woodruff, Meyers \& Zhu, 2018).
2. Attention needs to be paid not only to teaching positions that are unfilled, but also to positions filled temporarily or by teachers who lack full credentials. These are all types of "vacancies." Students in the state's schools with the highest needs must have access to fully qualified teachers who are retained, at a minimum, at rates similar to teachers statewide.

The study's survey data suggests that sizeable proportions of teachers in comprehensive support schools either are not fully credentialed or are working in temporary roles. A quarter of the principals responding to the survey reported having at least one teaching position unfilled on the first day of school, and a third of these principals reported at least one position not filled by the first of February. Unfilled teaching positions leave principals scrambling day-to-day to find temporary solutions, sometimes pulling specialists away from their regular assignments or relying on long-term substitutes, retire/rehires and teachers lacking full credentials to meet immediate staffing needs. These conditions sometimes result in curricular or programmatic changes, ultimately limiting learning opportunities for the students who need them most.

Both principals and HR staff responding to the survey identified special education as the hardest teaching position to fill. Other difficult to fill positions included mathematics and bilingual/dual language assignments. Many comprehensive support principals are at the elementary level, and elementary positions are now considered hard to staff.
3. There is a good deal of variation in recruitment, hiring and retention strategies used in comprehensive support districts and schools. Some recruitment strategies currently being used are reported as ineffective, and other practices might warrant consideration. With respect to retention strategies, survey results highlight the importance of highquality teacher professional development, collaboration, and mentoring as critical for supporting teacher retention.

Hiring practices varied considerably in these districts, particularly given differences in district size and location with some districts relying on multiple recruitment strategies while others focused on targeted practices and engaged with ESDs. Research suggests that using a limited set of recruitment practices may be negatively related to teacher qualifications and result in hiring less qualified teachers (Balter \& Duncombe, 2008). As our study suggests, human resource staff and principals do not necessarily agree on which strategies are most effective in recruiting teachers. One concern is that principals report engaging in strategies which they do not find to be effective for their schools, such as attending regional job fairs or encouraging paraeducators to become teachers. Nearly all principals in comprehensive support schools rated informal networking to identify prospective candidates as very effective, and there is some evidence to support the efficacy of such networking strategies (Simon et al., 2019). Other strategies, such as encouraging student teachers to apply for positions, direct contact with teacher preparation programs and working with their human resource staff to identify a pool of applicants, were viewed more favorably. But a majority of principals reported that they do not have easy online access systems for tracking applicants.

Except for additional compensation offered for extracurricular or administrative functions as part of a teacher's assignment, and district support for pursing National Board certification, few districts reported offering other recruitment incentives. From this survey evidence, it appears that districts are not developing packages of financial incentives that are honed to their specific needs (Kolbe \& Strunk, 2012). In particular, there was a lack of specific recruitment strategies aimed at teaching assignments in hard-to-staff fields or high-poverty schools. A lack of wellqualified applicants was the major obstacle principals identified in finding desirable candidates for their schools. Principals also noted a lack of amenities that other towns and cities offer, and salary and benefits that are greater in other districts.

A number of factors influence the timing of advertising for positions and extending offers to prospective candidates. The wide variation in practices reported in the survey data suggest that some districts may need to prioritize teacher recruitment earlier with a focus on high needs schools. For example, advertising for the following school year in these districts began as earlier as December and as late as May. However, $42 \%$ of responding districts reported making offers after May $1^{\text {st }}$ or later, which may make district offers less competitive.

Teacher retention is as important as recruitment in schools in comprehensive support. The principals who lead these schools reported that opportunities for effective teacher collaboration, high quality professional learning opportunities, and high-quality mentoring for new teachers were very important for teacher retention. This may be critical for supporting racially and ethnically diverse teachers (Achinstein, Ogawa, Sexton \& Freitas, 2010). The workforce in many schools in comprehensive support is younger and more diverse, but it is unclear if these new teachers of color are receiving targeted supports that would encourage them to remain in an assignment that is potentially more challenging.

## 4. While teachers in comprehensive support schools are somewhat more racially and ethnically diverse than teachers statewide, further diversification of the workforce is needed.

Diversification of the state's teacher workforce is a responsibility shared by state agencies, teacher education programs, and individual schools and districts. Since this report focuses primarily on state, district and school efforts to support school improvement in comprehensive support schools, we highlight a few issues raised in responses from principals and human resource staff.

While nearly all survey participants agreed that diversifying the teacher workforce was a district priority, not all agreed that the district had made substantial improvements in this effort. Additionally, three-quarters of HR staff felt the district had a teacher recruitment policy focused on the needs of Title 1 schools and schools in comprehensive support, but only $58 \%$ of principals indicated this was true for their district. Additionally, $38 \%$ of principals felt that the district did not attend to the needs of schools in an equitable fashion. We also note that twothirds of principals disagreed that the candidate interview process included sufficient input from community members. This perspective deserves attention because of the importance of authentic community engagement in addressing educational equity and school improvement (McAlister, 2013; Ishimaru, 2018).

These issues are well within the purview of the local district to act, as are incentives that may encourage a more diverse applicant pool. There is also a role for state agencies to play in reducing the barriers for diverse teacher candidates. For example, data gathered from surveys of principals and HR staff indicate that the vast majority encourage paraeducators to become teachers, but 30\% of principals rated this strategy as ineffective, and only $15 \%$ viewed it as very effective. This suggests that barriers exist to supporting paraeducators in pursuing their teaching credentials, particularly for teachers of color, and several strategies for addressing this challenge are now underway and being discussed at the state level.

In conclusion, we find that schools in comprehensive support could benefit from increased attention at all levels of the educational system regarding the strategies and supports that will help these schools attract and retain a diverse, well-qualified workforce.

[^4]
[^0]:    ${ }^{1}$ Traditional schools are those coded as "P" in OSPI's school demographic data. They do not include alternative schools, re-entry schools or other facilities offering specialized care for children or youth.
    ${ }^{2}$ While school demographic data is available for all 98 schools in comprehensive support, 6 schools lack personnel or other data needed for analyses. All 6 of these schools are in the "other" category of schools and include juvenile justice institutions or other facilities offering specialized care. Consequently, our sample of comprehensive schools for analyses is restricted to the 92 schools for which necessary data is available.

[^1]:    ${ }^{3}$ Certificated instructional staff with FTE designation $>0$ in a duty root of $31,32,33$, or 34 in the S275.

[^2]:    ${ }^{4}$ It should be noted that some principals who moved within the district also may have changed assignment (e.g., a move from principal to central office administrator).

[^3]:    ${ }^{5}$ Eleven schools were removed from this analysis due to insufficient data.

[^4]:    Note: OSPI Institutions (2) were excluded. In Bethel, Edmonds and Wenatchee, staff in these Comp Support Schools were coded in the S275 as something other than teacher.
